| AGENDA

- Example

| Total Average Access Time

$$T_a = T_s + \frac{1}{2r} + \frac{b}{rN}$$

| Example

- Consider a disk with an advertised average seek time of 4 ms, rotation speed of 15,000 rpm, and 512-byte sectors with 500 sectors per track. Suppose that we wish to read a file consisting of 2500 sectors for a total of 1.28 Mbytes. We would like to estimate the total time for the transfer

$$\begin{aligned} \checkmark T_s &= 4 \text{ ms} \\ r &= 15000 \text{ Rpm} = \frac{15000 \text{ Rev}}{1 \text{ min}} = \frac{15000 \text{ Rev}}{60 \text{ Sec}} \\ &= \frac{1 \cancel{15000} \text{ Rev}}{4 \cancel{60} \times \cancel{1000} \text{ ms}} = \frac{1}{4} \text{ Rev/ms} \end{aligned}$$

average rotational
✓ delay = 2 ms

sector size = 512 byte
sectors/track = 500

$$5 \text{ track} * \underline{\underline{500}} \text{ sector/track} = \underline{\underline{2500}} \text{ Sector}$$

$$T = \frac{b}{rN} = \frac{\cancel{500}}{r * \cancel{500}} = \frac{1 * \cancel{80} * \cancel{1000}}{15, \cancel{000}}$$

$$= 4 \text{ ms} \Rightarrow \text{to read } 500 \text{ sector}$$

 one track

• Average Seek $\Rightarrow 4 \text{ ms}$

• Average Rotational delay $\Rightarrow 2 \text{ ms}$

• Read 500 Sector $\Rightarrow \underline{\underline{4 \text{ ms}}}$
 $\underline{\underline{10 \text{ ms}}}$

①

1st 500 Sector

$$10 + 4 \times (\underline{\underline{2}} + \underline{\underline{4}})$$
$$= \underline{\underline{34 \text{ ms}}}$$

4 times

1 sector

$$(2) T = \frac{b}{r N} = \frac{1 \times 60 \times 1000}{15000 \times 500} = 0.008$$
$$\text{Total} = 2500 \times (4 + 2 + 0.008) = \underline{\underline{15.02 \text{ Sec}}}$$

| Note...

- The **order** in which sectors are read from the disk has a tremendous **effect** on I/O performance
- we **have some control over the way in which sectors of data are deployed.**
- Multiprogramming environment, there will be I/O requests competing for the same disk.
- Disk scheduling algorithms
